SUMMARY

Backend-focused Software Engineer with 2 years of experience building payment, wallet, and financial-transaction systems in Golang and Node.js. Skilled in event-driven architectures, REST APIs, and production observability, with a focus on reliability, scalability, and transactional consistency.

EDUCATION

Indian Institute of Information Technology

Bachelor of Technology – Electronics and Communication; CGPA: 7.99

Nagpur, India

Dec 2020 – May 2024

EXPERIENCE

Software Engineer | iOL World

Aug 2024 – Present

- Engineered secure, scalable backend microservices in Golang (REST APIs, JSON contracts) for a B2B payments platform serving ~1M requests/day, with resilient inter-service communication via retries, circuit breakers, and configurable timeouts.
- Designed and implemented a multi-currency virtual credit card (VCC) system enabling cross-border B2B travel payments across 31 currencies, integrating multiple card-issuing providers (Citi, Wex, CXP) through a pluggable connector/factory architecture with rule-based provider routing.
- Built a multi-currency digital wallet platform backed by a double-entry ledger guaranteeing transactional consistency across top-ups, transfers, funding, and refunds, supporting multiple payment methods and FX-based currency conversion.
- Built an event-driven webhook processing pipeline on Azure Service Bus with queue consumers, retry handling, idempotency checks, audit reporting, and dead-letter queue (DLQ) recovery, achieving 99% delivery reliability.
- Developed a standalone Go reporting service generating financial reports (VCC summaries, orders, wallet statements) in PDF/XLSX/CSV, with cron-scheduled, timezone-aware email delivery and paginated batch processing over PostgreSQL for large exports.
- Single-handedly designed and built an org-wide email notification microservice (Go, Gin, PostgreSQL) adopted by every team, with dynamic template rendering, multi-language fallback, SendGrid/SMTP delivery with automatic retries, and encrypted PDF generation on Azure Blob Storage.

Software Engineering Intern | NorthLadder

Dec 2023 – May 2024

- Built a payment and payout microservice that collects buyer payments, holds funds against an order, and disburses seller payouts, recording every money movement on a PostgreSQL double-entry ledger with balanced debit/credit pairs for full auditability.
- Designed idempotent payment APIs using unique-constrained, client-supplied idempotency keys and row-level locking on account balances, eliminating duplicate charges and lost-update race conditions under concurrent requests.
- Modeled payment and payout lifecycles as explicit state machines (pending → authorized → captured → settled), releasing seller payouts only after the buyer payment is captured, with retry handling for failed disbursements.
- Integrated an external payment gateway via asynchronous webhooks with idempotent, out-of-order-safe handlers reconciling gateway events against internal records, plus a cron-driven worker settling payouts within a 48-hour SLA using job cursors to prevent double payment.

TECHNICAL SKILLS

Languages: C/C++, Golang, JavaScript, TypeScript, SQL, HTML/CSS

Frameworks: Gin, Gorilla Mux, GORM, Node.js, Express.js, React.js

Databases: PostgreSQL, MySQL, MongoDB

Cloud & Messaging: Azure, Azure Service Bus, Azure Blob Storage

Concepts: Microservices, REST APIs, Event-Driven Architecture, Webhooks

Observability: Elasticsearch, New Relic (APM & structured logging)

Developer Tools: Git, GitHub, Docker

CODING PROFILES

LeetCode: manasgoyal95 | **Codeforces:** manasgoyal95 | **CodeChef:** goyal_manas
